PROFESSIONAL SUMMARY

Computer Engineering student at UADE focused on backend development with Java, Spring Boot, Python and SQL. I design and direct SimpleStock, a point-of-sale system with a REST API, idempotent operations and 900+ automated tests, running in a real pilot shop. I've built data pipelines that consume REST APIs and persist data in SQLite. Interested in AI and machine learning.

EDUCATION

Computer Engineering (Ingeniería Informática)

UADE – Universidad Argentina de la Empresa | Mar 2026 – Present

Information Systems I: Agile methodologies and Scrum.

TECHNICAL SKILLS

Languages: Java, Python, SQL, TypeScript, JavaScript, HTML, CSS

Backend: Spring Boot, Spring Security, Spring JDBC, REST APIs, Maven, Flyway (migrations), BCrypt

Databases: SQLite, SQL, relational data modeling, versioned schema migrations

Testing: JUnit 5, Vitest, unit and integration testing, concurrency testing

Frontend: React, Vite

Data: Pandas, Matplotlib, Jupyter, Streamlit, Requests, ETL, Excel, Power BI

Tools and deployment: Git, GitHub, GitHub Pages, Cloudflare Workers, Inno Setup, Windows Task Scheduler

Concepts: Layered architecture, idempotency, concurrency, Agile methodologies (Scrum)

Soft skills: Teamwork, self-directed learning, problem solving, communication with end users

Spoken languages: Spanish (native), English (B2)

PROJECTS

SimpleStock · Point-of-sale and inventory system for convenience stores

Oct 2026 – Present (v0.5) | simplestockpos.com.ar · private code, available to show in an interview

- Designed and direct a commercial product installed on the shop's PC and used from any browser on the local network. Running in a real pilot shop. AI used as an implementation tool.
- Defined a layered REST API with Java, Spring Boot, Spring Security and Spring JDBC over SQLite, with Flyway migrations and an architecture test that enforces layer dependencies.
- Ensured financial correctness: money as integer cents, server-side amount calculation, idempotent sales, immutable records and a SHA-256 hash-chained audit log.
- Validated with 900+ automated tests (JUnit 5, Vitest) covering concurrency, idempotency and migrations. Frontend built with React, TypeScript and Vite.
- Shipped a Windows installer (Inno Setup) with Ed25519-signed licenses, automatic backups, PDF receipts (PDFBox) and serial-port device integration (jSerialComm).

Argentina Dólar Tracker · Data pipeline and website

Jun 2026 | github.com/Tonxt/argentina-dolar-tracker

- Built a Python ETL pipeline that consumes a public REST API (DolarAPI) with Requests, cleans data with Pandas and stores 7 daily USD exchange rates in SQLite.
- Published a live website with history (HTML, CSS and JavaScript on GitHub Pages) and a Streamlit dashboard; automated daily runs with Windows Task Scheduler.

Olist E-Commerce Analysis

Jun 2026 | github.com/Tonxt/olist-ecommerce-analysis

- Performed exploratory data analysis (EDA) on 99,000+ orders with Python, Pandas and Matplotlib in Jupyter: revenue, categories and regional distribution.

Python Programming Competition – UADE

2026

- Solved programming problems in Python as part of a team under time constraints.
